

Quizlet

Nature of Science 1-1

Study online at quizlet.com/_3mvdy/

1. Controlled experiment	an experiment in which all of the variables except for one remain the same
2. Data	the facts and figures, and other evidence gathered through observation
3. Hypothesis	an explanation to a set of observations
4. Inference	an interpretation of an observation that is based on evidence or prior knowledge
5. Manipulated variable	a variable that is changed in the experiment
6. Observation	a skill that involves the one or more of the five senses
7. Responding variable	a factor that changes as a result of the manipulated variable
8. Science	a way of learning about the natural world and the knowledge gained through that process
9. Scientific Inquiry	diverse ways in which scientists study the natural world
10. Scientific Theory	a well tested concept that explains a wide range of observations
11. Variables	any factor that can change during an experiment

Quizlet

What is Life 1-1

Study online at quizlet.com/_3ueoxy/

1. autotroph	an organism that makes its own food
2. heterotroph	organism that cannot make its own food
3. spontaneous generation	the mistaken idea that living things arise from non-living things

Quizlet

Parts of a microscope

Study online at quizlet.com/_3xere8/

1. body tube	allows light from the objective lens to pass upward to form the first magnified image
2. low power objective lens	lowest power lens 4x magnification use this FIRST
3. medium objective lens	middle power usually 10x or 25x magnification, use this second
4. high objective lens	highest power usually 40x use this last
5. stage	the platform that supports the specimen. Has hole in center to let light pass through.
6. coarse adjustment knob	larger knob moves the stage to focus the specimen. DO NOT USE WITH HIGHEST POWER. MOVE SLOWLY
7. fine adjustment knob	used to bring the specimen into final focus
8. Light Source	Light bulb or mirror that provides light to pass through specimen

Quizlet

Scientific Classifications

Study online at quizlet.com/_43mzcu/

1. 3 domains	Eukarya Archaea Bacteria
2. 6 Kingdoms	Eubacteria Archaeabacteria Protista Plantae Fungi Animalia
3. Bacteria	Peptidoglycan in cell membrane
4. binomial nomenclature	each organism is given a two part name
5. taxonomic key	a series of paired statements that describe the minimum characteristics

Quizlet

Study online at quizlet.com/_3zmleq

1. cell membrane: lipid and protein layer around a cell. Protects allows materials to pass in and out. All cell have a membrane
2. cell wall: PLANTS ONLY protects the cell and regulates what substances enter and leave the cell.
3. endoplasmic reticulum: rough (sheets) or smooth (tubes) found throughout cell connected to nucleus. Rough ER make proteins pass to golgi bodies. Smooth ER store lipids and steroids
4. eukaryotes: cell that has a nucleus and organelles
5. golgi bodies: stack of membrane (pancakes) receives proteins from Rough ER puts them together and ships out to the cell
6. mitochondria: rod shaped structures located in the cytoplasm breaks down nutrients converts to energy
7. nucleus: larger round structure toward the middle of a cell. contains DNA RNA nucleolus
8. prokaryotes: cells that do not have a nucleus or organelles
9. ribosomes: grain-like found in cytoplasm or endoplasmic reticulum. Protein builders

Quizlet

Cell Theory

Study online at quizlet.com/_3xep5r

1. Antony Van Leeuwenhoek: Made microscope observed pond water. Saw "animalcule" little animals (unicellular). Observed teeth scrapings. Saw bacteria
2. Robert Hooke: Observed piece of cork through home-made microscope. Used word CELLS
3. Virchow: Inferred new cells can only come from existing cells. "All cells come from cells"

Quizlet

Cell Process and Energy

Study online at quizlet.com/_48u6tv

1. Active Transport: the movement of material through a membrane using energy
2. atom: the smallest unit of an element
3. carbohydrates: energy rich organic compound made of carbon, hydrogen, and oxygen. raw materials for cell parts. sugars and starches
4. compound: when two or more different elements are chemically combined
5. diffusion: The process by which molecules tend to move from an area of higher concentration to lower concentration
6. DNA: deoxyribonucleic acid. Genetic material that carries information about an organism
7. element: a substance that cannot be broken down into simpler substance; all the atoms are the same
8. molecule: the smallest unit of most compounds. Two or more atoms bonded together
9. nucleic acid: large organic molecule made of hydrogen, carbon, oxygen nitrogen, and phosphorus
10. osmosis: the diffusion of a fluid, usually water, through a membrane. From high concentration to lower concentration
11. Passive Transport: the movement of material through a cell membrane without using energy
12. protein: large organic molecules made of carbon, hydrogen, oxygen, nitrogen, and sometimes sulfur. Used for tissue growth and repair
13. RNA: Help in the production of proteins
"Ribonucleic Acid"
14. Selectively Permeable: Some substances can pass through cell membrane while others cannot.

Quizlet

Genetics

Study online at quizlet.com/_4fgj9b

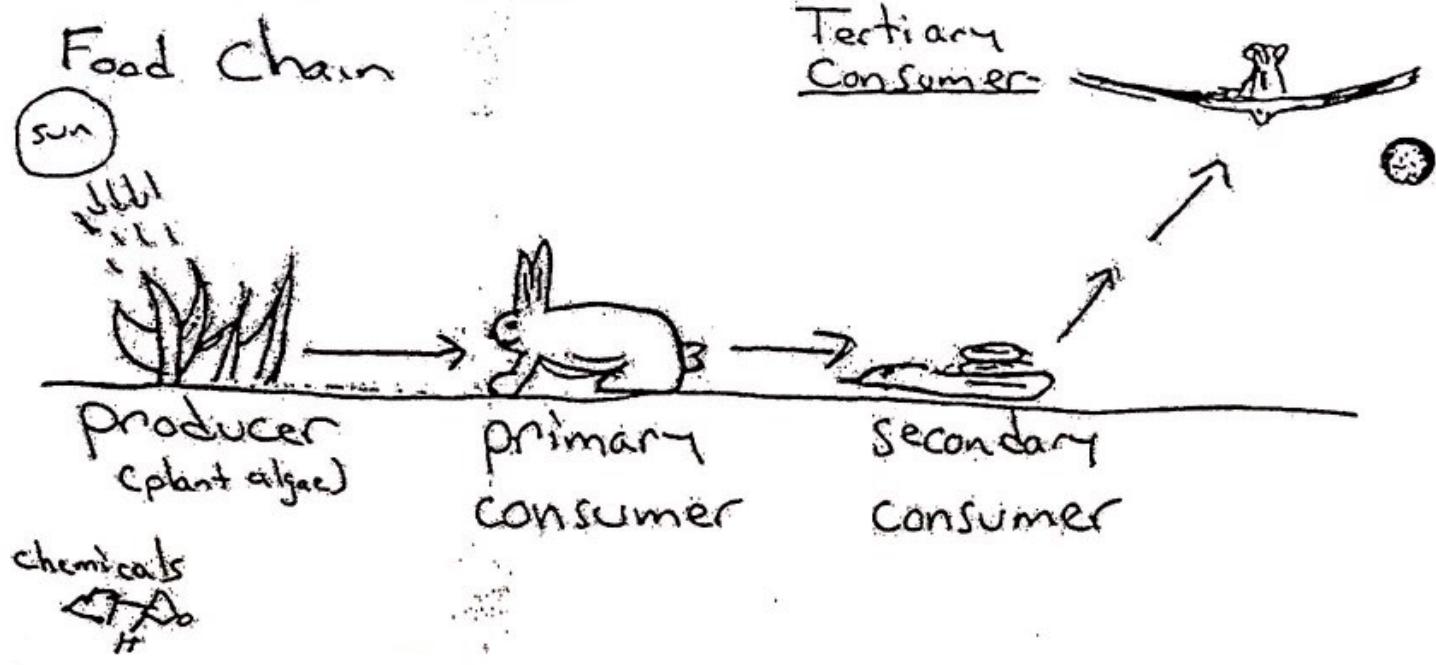

1. Dominant Allele: trait always shows up when present in an organism
2. Genotype: allele combinations
3. Heredity: The passing of traits from the parent to offspring
4. Heterozygous: genotype that has two different alleles
5. Homozygous: genotype that has two identical alleles for a trait
6. Phenotype: visible trait physical appearance
7. Punnett square: a chart that shows all the possible combinations of alleles that could result from genetic crosses

Quizlet Ecology

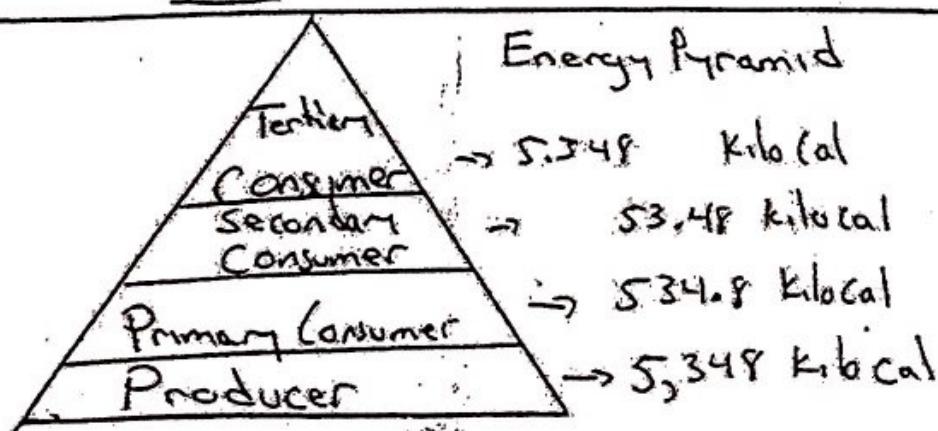

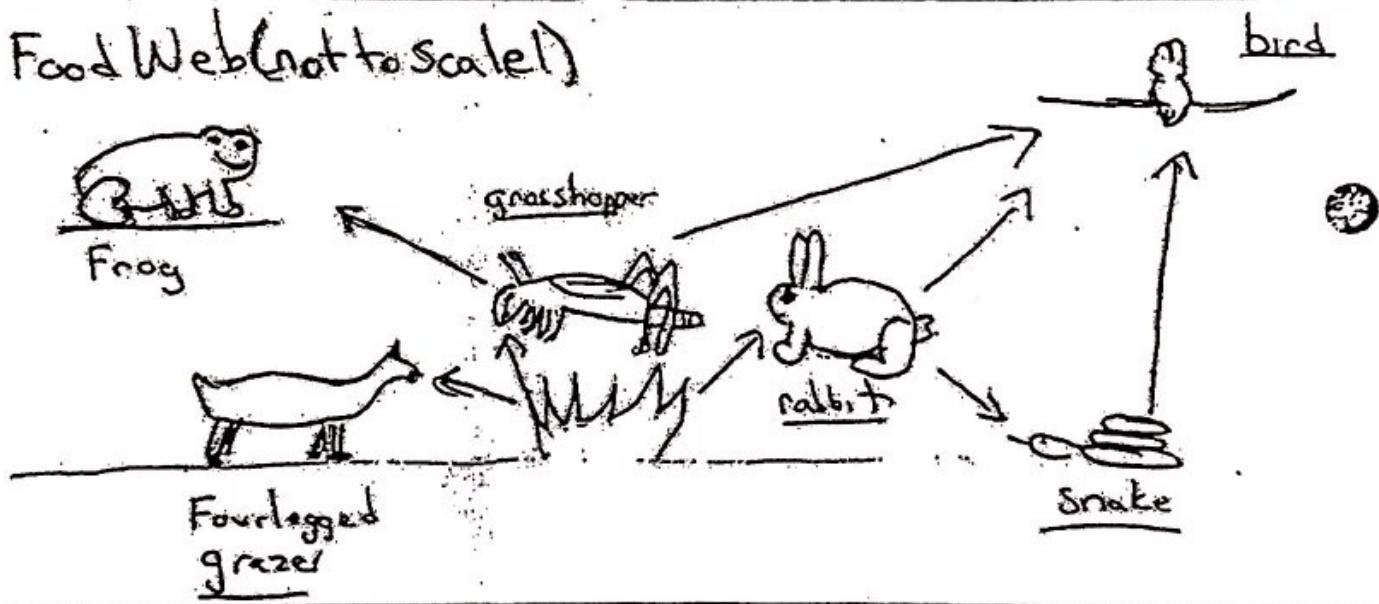

Study online at quizlet.com/_4umd9z

- | | |
|--------------------------------|---|
| 1. Abiotic Factor | Non-living parts of an ecosystem. |
| 2. Abiotic Factor examples | wind, rain, soil, temperature, sunlight |
| 3. Biotic Factor | Living parts of an ecosystem |
| 4. Biotic Factor Examples | hawk, lady bug, grass, trees, bacteria, ants, lobster, coral etc. |
| 5. Commensalism | A type of symbiotic relationship where one of the organisms benefits and the other is not harmed. |
| 6. Community | All the different populations in a community
mice, ladybugs, garter snakes, worms, etc |
| 7. Determining Population Size | Direct Observation
Indirect Observation
Sampling
Mark and Recapture |
| 8. Habitat | a place where an organism lives and that provides the things the organism needs |
| 9. Mutualism | A type of symbiotic relationship where both organisms benefit |
| 10. Parasitism | A type of symbiotic relationship where one of the organisms benefits and the other is harmed |

Food Chain

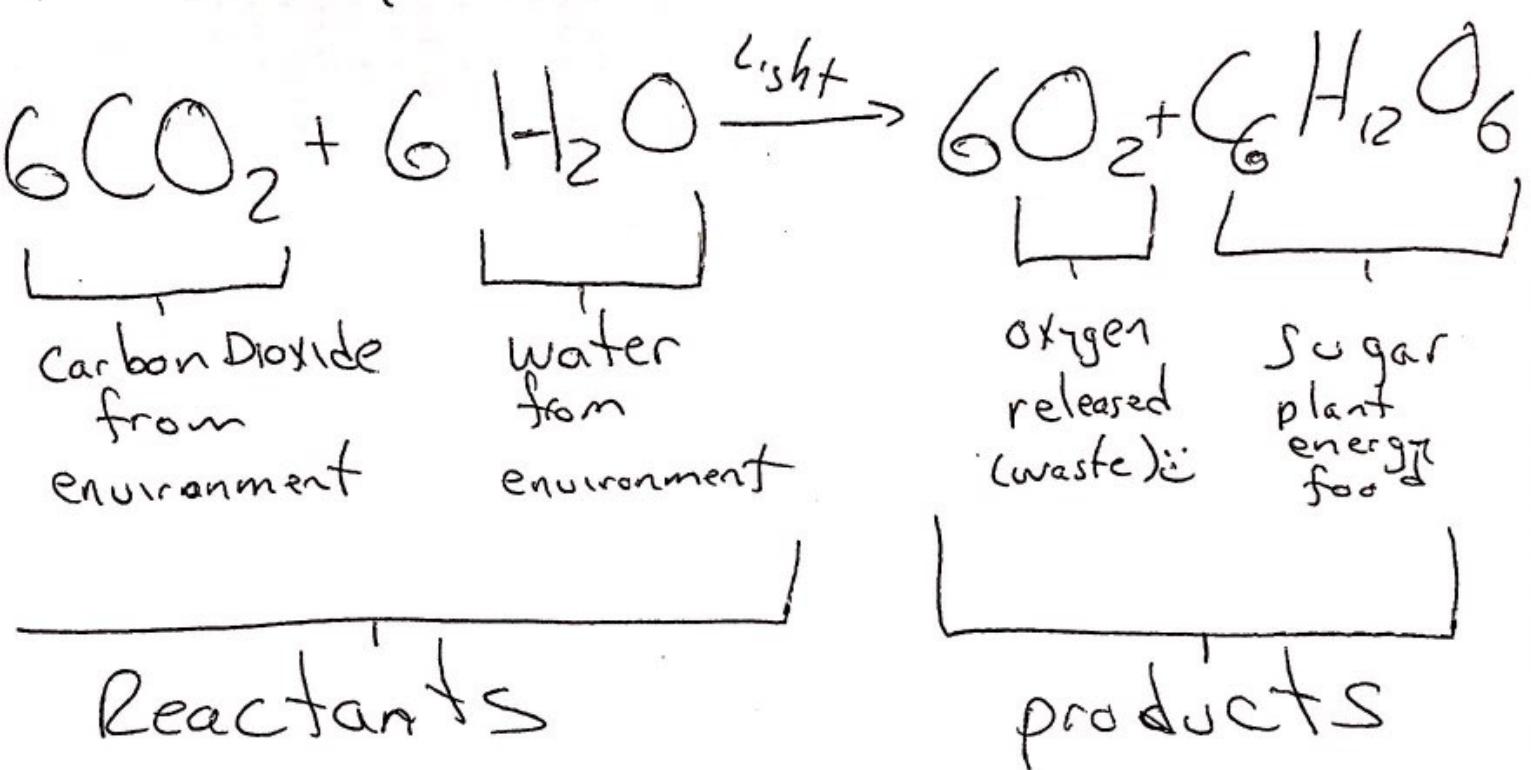

Food Web (not to scale)

Only 10% of
the energy
moves to the
next level

Photosynthesis Formula

Photosynthesis Reactants

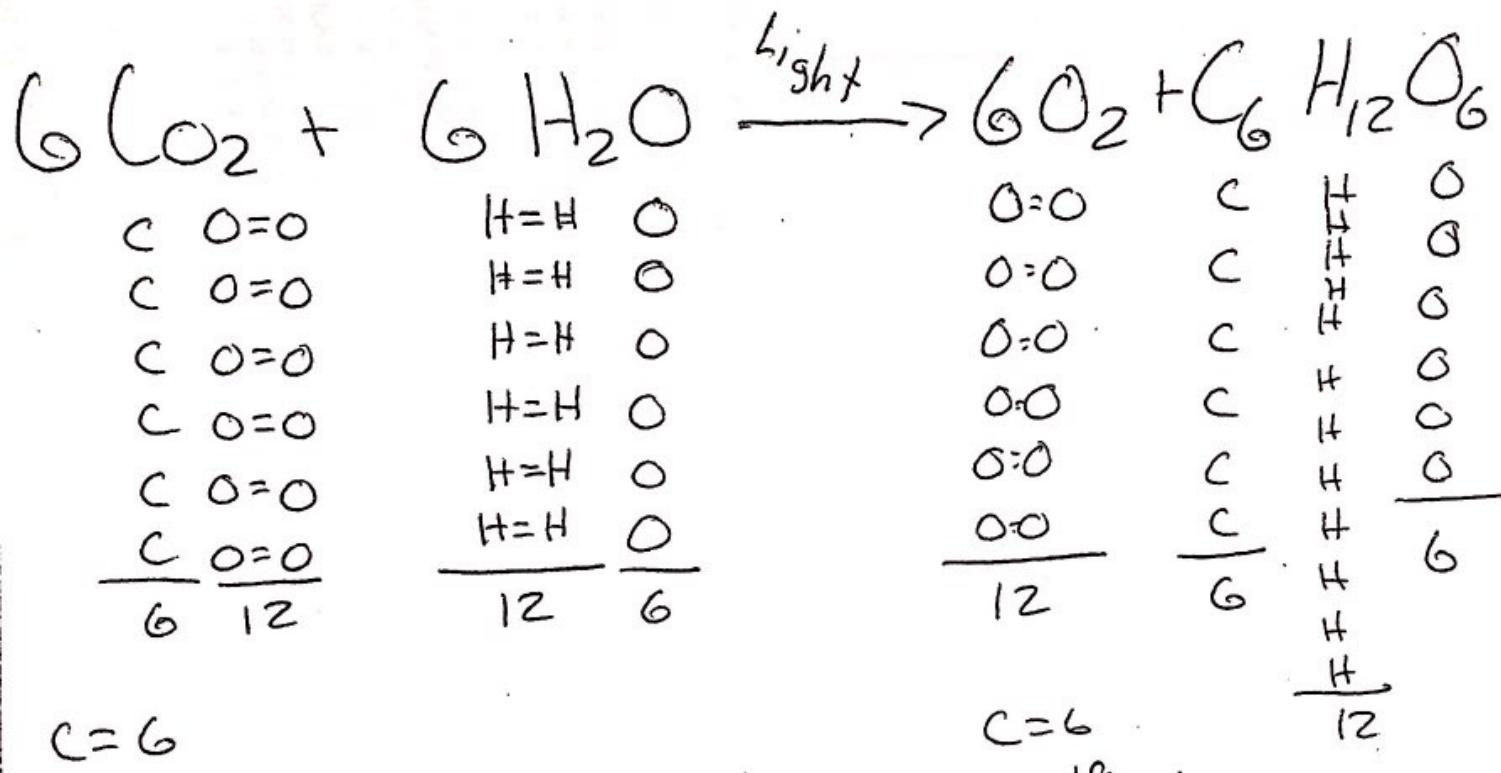

- Carbon dioxide
 - Water

Photosynthesis products

- Oxygen
 - Sugar

said: "Six Carbon dioxide plus 6 water in the presence
of light yields 6 oxygen and sugar"

Photosynthesis is Balanced

$$\text{C} = 6$$

$$\text{O} = 18$$

$$\text{H} = 12$$

$$\text{C} = 6$$

$$\text{O} = 18$$

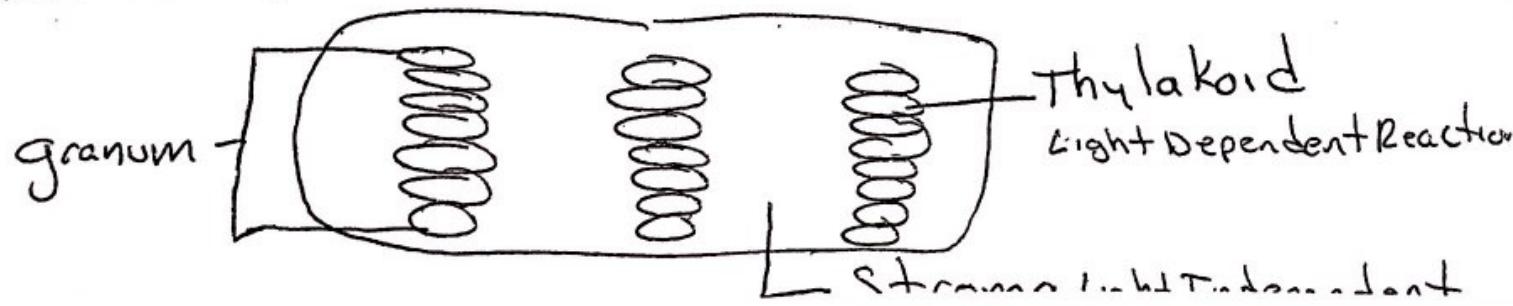

$$\text{H} = 12$$

Photosynthesis is a 2 step process

1. Light dependent reaction - needs light

2. Light independent reaction - does not need light
"Dark Reaction"
"Calvin Cycle"

Both steps take place in the chloroplast

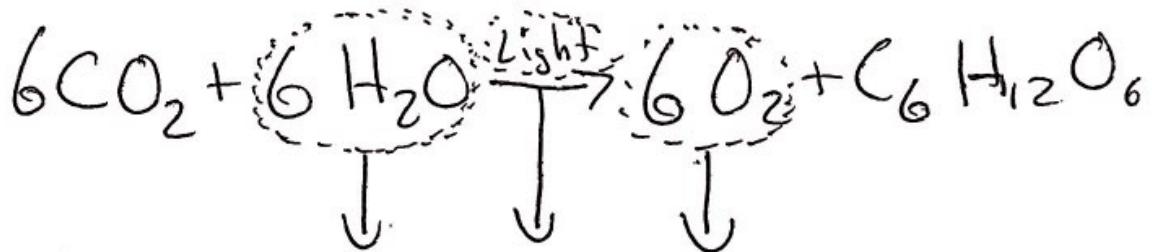

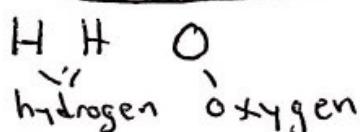

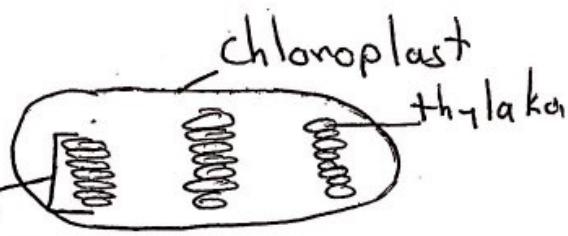

Photosynthesis

Steps

1. Light Dependent Reaction - needs light
2. Light Independent Reaction - does not need light
 - Dark reaction
 - Calvin cycle

Light Dependent Reaction

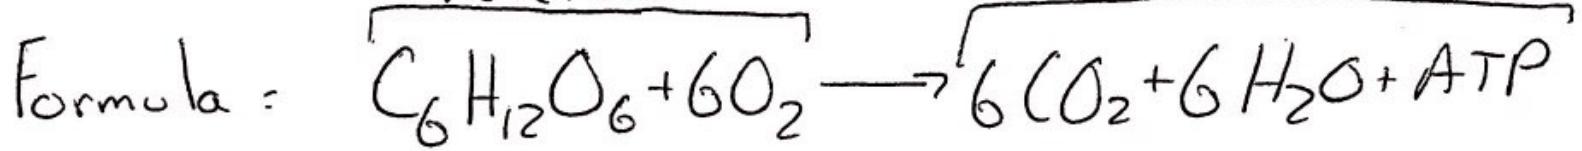

- In chloroplast - thylakoid granum
- Light helps "cut" water H_2O
 - H is kept
 - O is released
- ATP
 $NADPH$ created and passed onto Dark reaction

Light Independent Reaction

- The above molecules and light are involved in the Light Independent Reaction
- The Carbon dioxide and glucose will be involved in the Light Independent Reaction (Dark Reaction) (Calvin Cycle)

Cellular Respiration

3 Step Process

1 Glycolysis

2 Krebs Cycle or "Citric Acid Cycle"

3 Electron Transport chain

Step 1: Glycolysis

- happens in cytoplasm outside the mitochondria
- does not need oxygen = anaerobic
- $C_6H_{12}O_6$ broken down: 2 pyruvates $\xrightarrow{\begin{matrix} O^- \\ C=O \\ C=O \\ CH_3 \end{matrix}}$

2 ATP
2 NADH
(used to transfer electrons later)

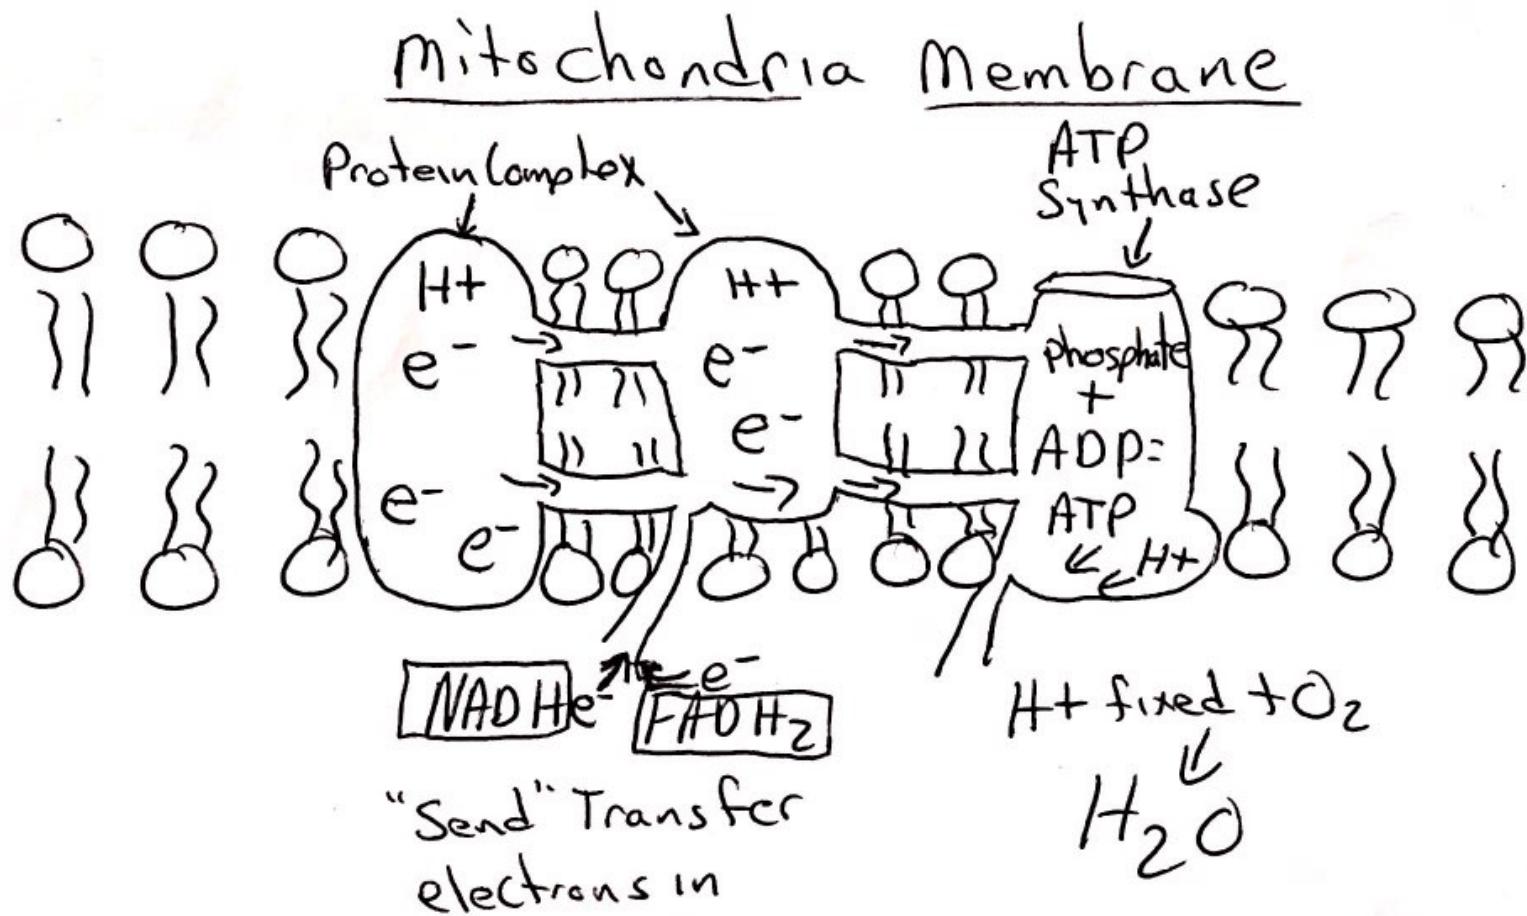

Step 2: Krebs Cycle or Citric Acid Cycle

- happens in mitochondria
- requires oxygen = aerobic
- O_2 is fixed to pyruvates
- makes CO_2 6 more NADH 2 FADH₂
2 more ATP

(transfer electrons) (also transfer electrons)

Step 3 : Electron Transport Chain

- happens in membrane of the mitochondria
- oxygen needed = aerobic
- electrons from NADH and FADH₂ are transferred through special proteins in the membrane
- Protons (H⁺) move across membrane toward ATP Synthase - special enzyme in the membrane
- In ATP Synthase - a phosphate is added to ADP forming ATP
- Oxygen combines with H⁺ to make H₂O
- makes a total of 32-38 ATP

Fermentation

why do fermentation? No or low oxygen
no mitochondria

Two Types of fermentation

1. Lactic Acid
2. Alcoholic

1. Lactic Acid

- glycolysis $\begin{cases} \text{sugar converted to pyruvates} \\ \text{NADH created} \end{cases}$
- H removed from NADH leaving NAD⁺
- H is fixed onto pyruvate forming Lactate (lactic acid)
- ATP created
- NAD⁺ is recycled

2. Alcoholic

- glycolysis $\begin{cases} \text{sugar converted to pyruvates} \\ \text{NADH is created} \end{cases}$
- H is removed from NADH leaving NAD⁺
- H fixed to pyruvate forming ethyl alcohol
- ATP formed CO₂ released
- NAD⁺ is recycled

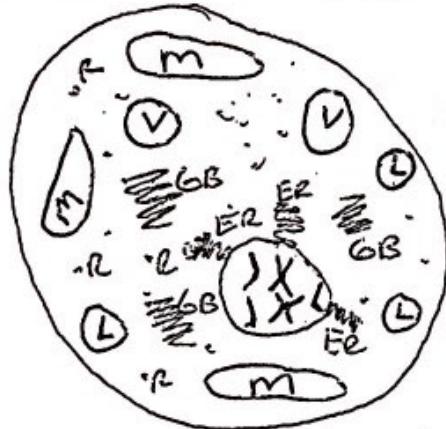

Lactic Acid

You perform this when you are doing extreme exercises
"feel the burn" lactic acid

Alcoholic

Used in wine making
yeast convert sugar to alcohol

INTERPHASE

- DNA begins to duplicate
- Developing
 - making more cytoplasm
 - making more organelles
- Growing cell getting bigger

m-mitochondria

V-vacuole

L-lysosome

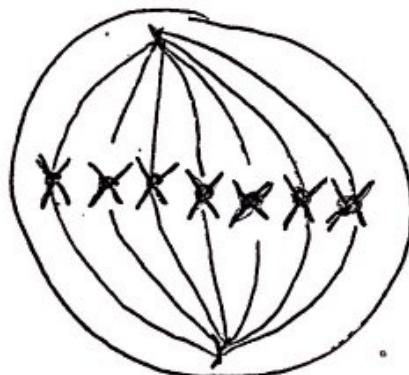

ER-endoplasmic reticulum

gb-golgi body

X-single chromatid

X-sister chromatid

Mitosis - Metaphase

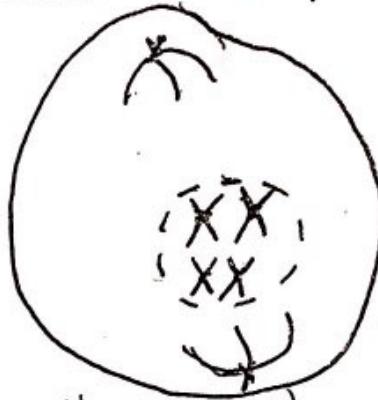

- DNA move toward center of cell

Spindle fibers attach to centromeres

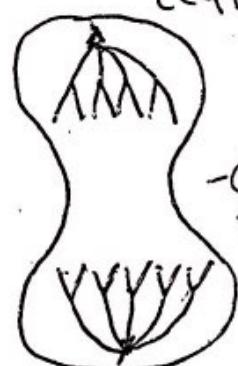

Phase is over as soon as chromosomes begin retract
46 chromosomes 92 chromatid

Mitosis - Prophase

- All organelles made
- Nuclear membrane dissolves
- All DNA duplicated
- Centrioles form and move toward poles
- Spindles begin to form
- Chromosomes begin to flow into cytoplasm
- 46 chromosomes 92 chromatid

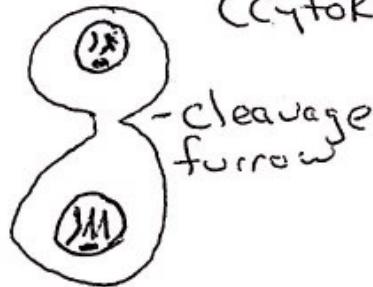

Mitosis - Anaphase (cytokinesis)

-Cleavage Furrow

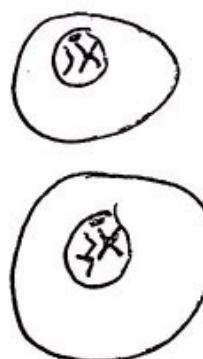

- Separated chromatid move toward centrioles
- Spindle fibers retract
- Chromatids move toward centrioles
- cell membrane begins to "pinch in"

Mitosis - Telophase (Cytokinesis)

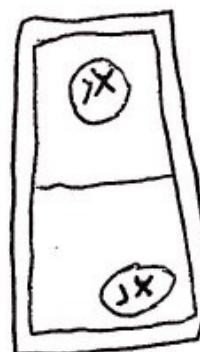

- Nuclear membranes form
- Nuclei form
- Chromatid begin to straighten
- Nucleolus begin to form
- Cell membrane pinches in more

Cytokinesis

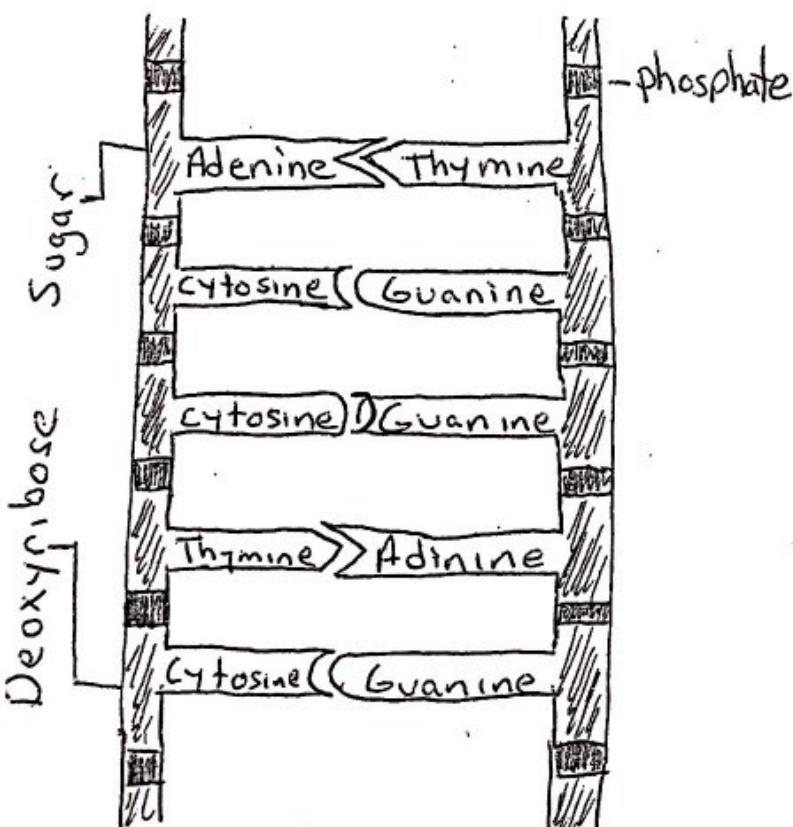

- 2 daughter cells
- Nuclei and structures grow and develop
- Interphase begins

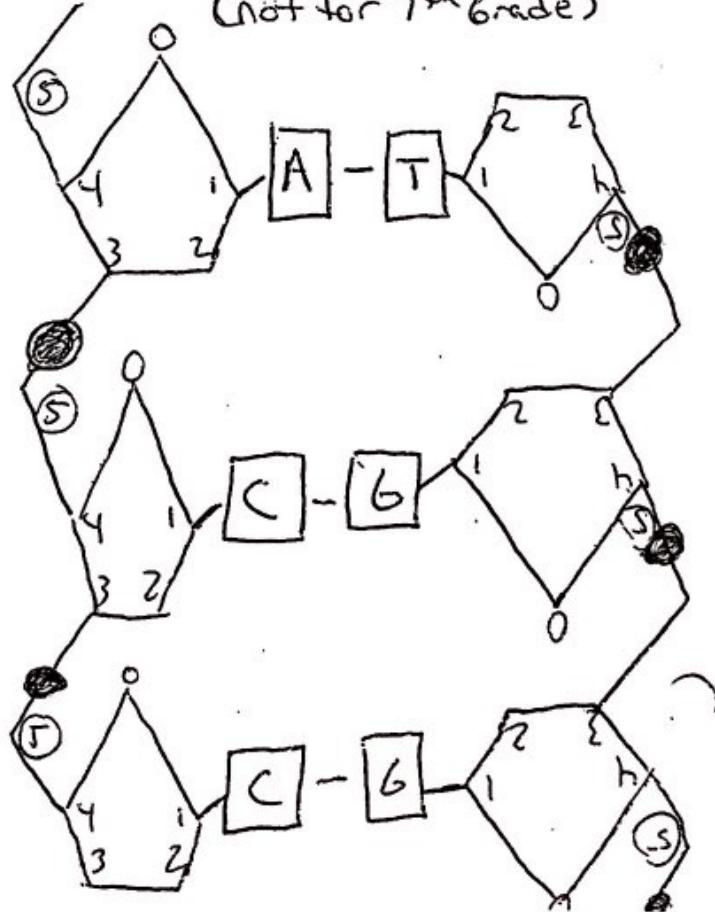

- too rigid for cell wall to "pinch" in
- cell plate forms to separate daughter cells

Know this

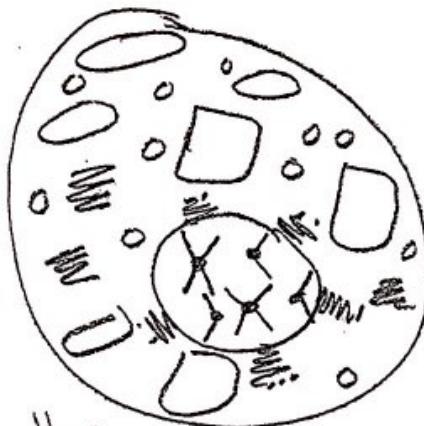

DNA Duplication

DNA Duplication (Not for 7th Grade)

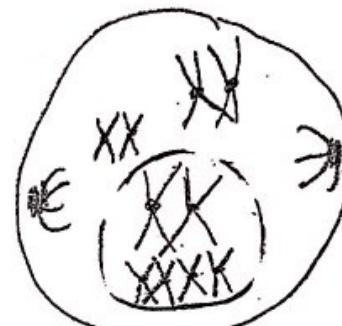

Interphase (meiosis)

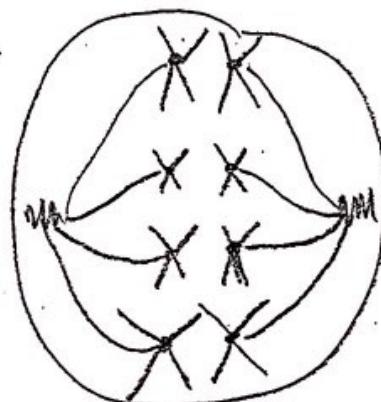

1. Organelles Duplicate
2. Cytoplasm increases
3. Grows Develops.

Meiosis + Prophase I M A T

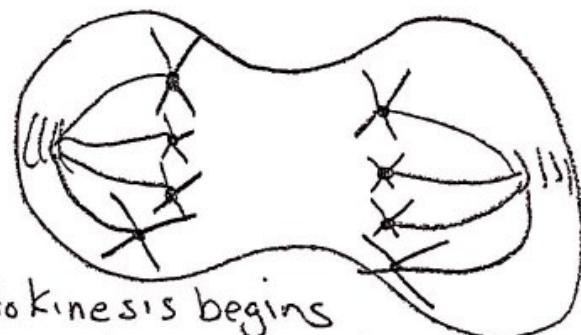

1. All chromatid duplicated
 $46 \text{ Chromosomes} = 92 \text{ chromatid}$
 2. Chromosomes begin to find their homologous pair - genetical similar chromosomes
 3. Cross over may occur - swapping genes - diversity
 4. Centrioles/spindle fibers
- meiosis I

P Metaphase I A T

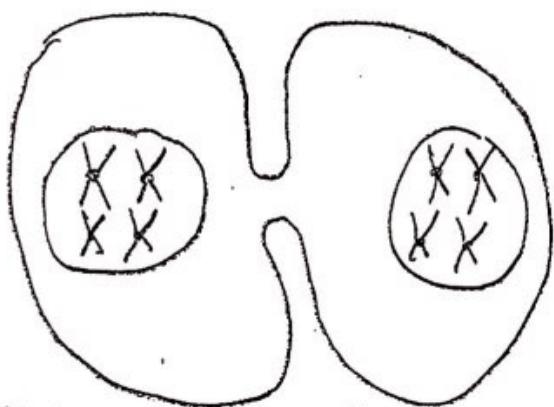

1. Homologous pairs line up in middle
2. Spindle fibers attaching
3. $46 \text{ Chromosomes} = 92 \text{ chromatid}$

P M Anaphase I T (Cytokinesis)

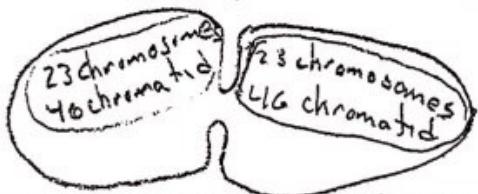

1. Cytokinesis begins
2. Spindle fibers retract
3. $23 \text{ Chromosomes going toward each pole.} = 46 \text{ chromatid toward each pole.}$

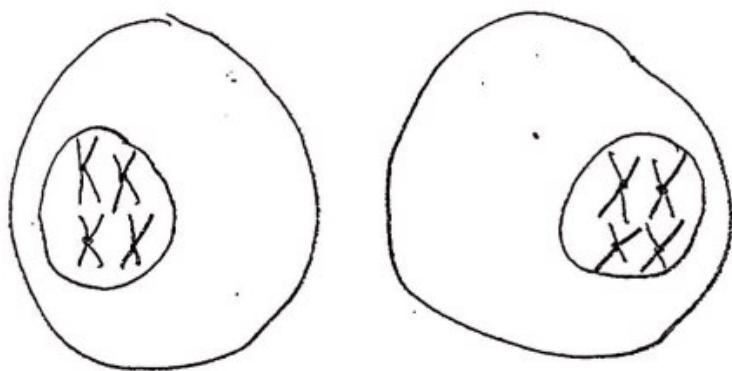

P M A Telophase I

1. Cleavage Furrow deepens
2. Nuclear Membrane returns
3. Nucleolus Returns
4. Centrioles / Spindlefibers gone

Cytokinesis

- 1 Genetically different cells
- 2 Called gametes

Mitosis II

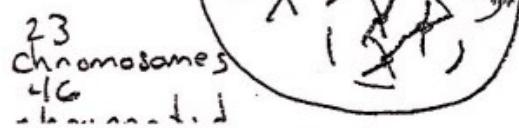

Prophase II M A T

Nuclear Membranes begin to break down again.

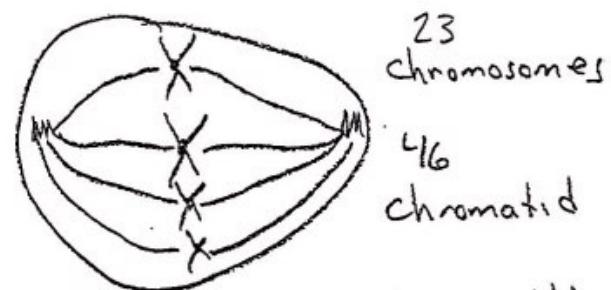

Centrioles and Spindle fibers reappear

Chromosomes move into cytoplasm

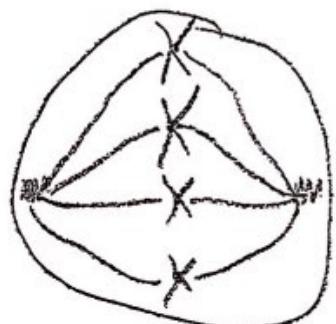

Mitosis II

P Metaphase II A T

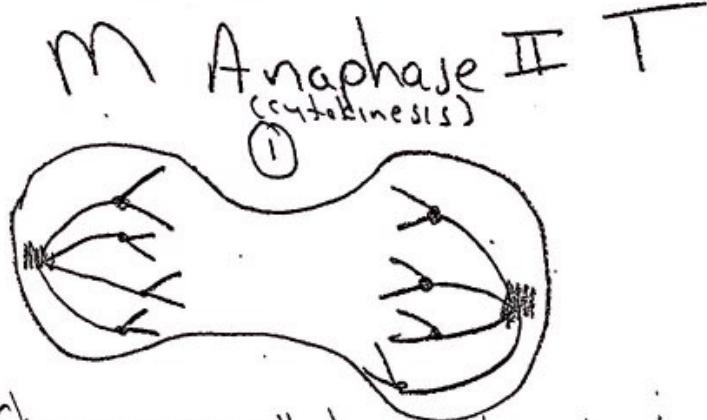

1. Chromosomes line up in the middle
2. Spindle fibers attaching to centromeres

23 chromosomes
46 chromatid

Mitosis II

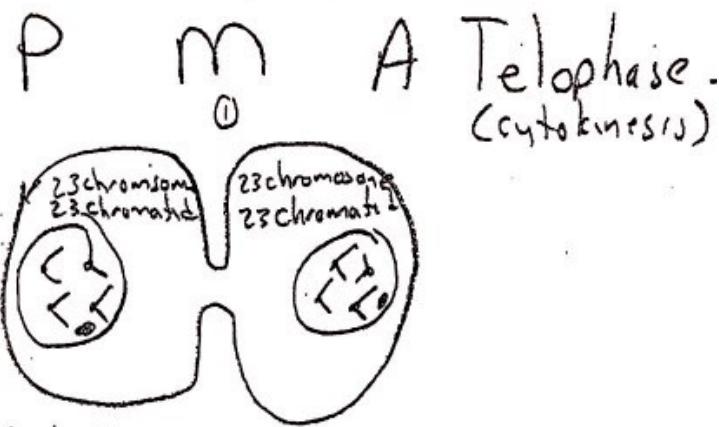

1. Chromosomes pulled apart by retracting spindle fibers

2. 23 chromosomes
23 chromatids

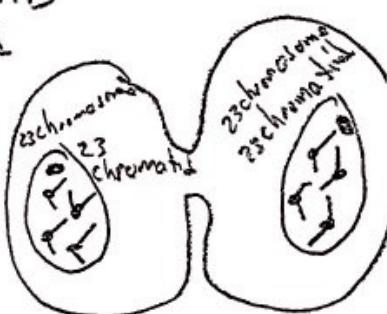

① → 23 chromosomes
23 chromatids

3. 23 chromosomes
23 chromatids
 4. Cytokinesis begins
- ② → 23 chromosomes
23 chromatids

Mitosis II

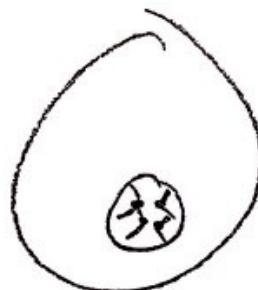

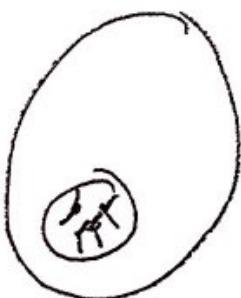

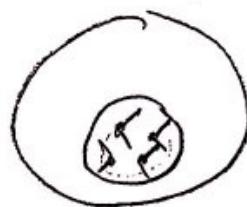

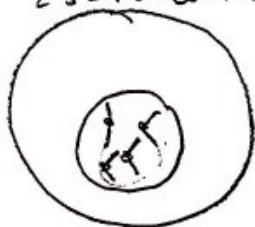

1. Cytokinesis continues
2. Nuclear membrane returns
3. Nucleolus returns
4. Centrioles and spindle fibers gone

Cytokinesis

23 chromosomes
23 chromatids

T vs Short Plant Height

Genotype: Plant height

Genotype: T tall - dominant allele
+ short - recessive allele

TT: homozygous / purebred / Tall] possible allele combination
T+: heterozygous / hybrid / Tall]
++: homozygous / purbed / short]

Scenario #1 Tall purebred plant crossed with tall hybrid plant

Punnett square ↗

TT

T	TT	TT
+	T+	T+

represents probability of offspring

100% Tall
50% homozygous
50% heterozygous

Scenario #2 Tall hybrid plant crossed with a homozygous short plant.

T+

+	T+	++
+	T+	++

Probability
50% Tall: heterozygous (T+)
50% Short: homozygous (++)

Creating an F₁ and F₂ Generation

"Parent" Group or P₁ generation

phenotype: yellow or green leaves

Dominant: yellow = Y

possible Allele

Recessive: green = y

YY = yellow yy = green
Yy = yellow

Parent Group: heterozygous crossed with a green leaf plant

	Y	y
Y	Yy	yy
y	Yy	yy

P₁

50% heterozygous yellow (Yy)

50% homozygous green (yy)

F₁ generation is the crossing of two of the offspring from the Parent Group. Choosing to cross Yy and Yy

	Y	y
Y	YY	Yy
y	Yy	yy

50% heterozygous yellow (Yy)

25% homozygous yellow (YY)

25% homozygous green (yy)

F₂ generation is the crossing of two of the offspring from the F₁ generation. Choosing to cross YY and Yy

	Y	y
Y	YY	YY
y	Yy	Yy

50% heterozygous yellow (Yy)

50% homozygous yellow (YY)

Codominant

Codominance - neither allele is dominant nor recessive

Phenotypes Black feathers

White feathers

Black/White feathers

All capital letters (genotype)

B^B = black feathers

W^W = white feathers

$B^B W^W$ = Black/White feathers

Crossing a black feather chicken with a white feather chicken

F^B F^B (black)

F^W (white)	B^W	B^W
	FF	FF
	FF	FF

Phenotype of offspring both black/white
Genotype $F^B W^W$

Crossing a black and white chicken with a white chicken

F^B F^W (black/white)

F^W (white)	B^W	w^w
	FF	FF
	FF	FF

50% Black and white $F^B w^w$

50% white $F^W w^w$

Incomplete Dominance

Incomplete Dominance - when two organisms are crossed and it is possible to see a new phenotype

Phenotypes: color of petals on a flower: white, red.

Genotypes: WW = White
RR = Red

Crossing an incomplete dominant Red plant with an incomplete dominant White plant.

(White) R R (Red)

W	RW	RW
W	RW	RW

P₁

phenotype of offspring = pink

Genotype: RW

100% pink

Creating an F₁ generation

R W		Genotype	phenotype	probability
R	RR	(1) RR =	red	25%
W	RW	(2) RW =	pink	50%
	WW	(3) WW =	white	25%

Creating an F₂ generation

R R		Genotype	phenotype	probability
R	RR	(1) RR =	red	50%
W	RW	(2) RW =	pink	50%

Blood Types

Codominant I i

A = I^A I^A

BB I^B I^B

OO i i

AB I^A I^B

AO I^A i

BO I^B i

"I" represents "blood" A or B represents type of blood

"i" represents type "O" blood

I^{AA} = you say "Type A blood"

I^B I^B = you say "Type B blood"

I^A I^B = you say "Type AB blood"

I^A I = you say "Type AO blood"

i i = you say "Type O blood"

Blood Type is Genetic
you inherit your blood type from your parents

Mom Type "A"

	I ^A	I ^A
I ^B	I ^A I ^B	I ^A I ^B
I ^B	I ^A I ^B	I ^A I ^O

100% probability
all offspring will
be Type AB

Mom type AO

	I ^A	i
I ^B	I ^A I ^B	I ^B i
I ^B	I ^A I ^B	I ^A I ^O

50% AB

50% BO

Sex Linked Traits

Humans have 46 chromosomes. One pair (2) chromosomes determine the gender of a person.

$\underbrace{XX}_{\text{chromosome}} = XX = \text{female}$

$\underbrace{XY}_{\text{chromosome}}^{\text{Y smaller}} = XY = \text{male}$

- Some traits are sex linked = linked or attached to the sex chromosomes that determine the gender
- Hemophilia is sex linked. H = dominant = no hemophilia
h = recessive = hemophilia
- $X^H X^H$ = female homozygous = no hemophilia
- $X^H X^h$ = female heterozygous = no hemophilia
- $X^h X^h$ = female homozygous = hemophilia
- $X^H Y$ = male = no hemophilia
- $X^h Y$ = male = hemophilia

Sex linked traits mostly only on X chromosome

Sex Linked Punnett Squares

Mom is homozygous for not having hemophilia

$X^H X^H$

Dad has hemophilia

$X^h Y$

	X^H	X^H
X^h	$X^H h$	$h h$
Y	$X^h Y$	$h Y$

50% female
heterozygous
no hemophilia
50 male
no hemophilia

Mom is heterozygous for not having hemophilia

$X^H X^h$

Dad has hemophilia

$X^h Y$

	X^H	X^h
X^h	$X^H h$	$h h$
Y	$X^h Y$	$h Y$

1. female heterozygous
no hemophilia
1. female homozygous
has hemophilia
- 1 male nohemophilia
- 1 male has hemophilia

Mom is heterozygous for not having hemophilia $X^H X^h$
Dad does not have hemophilia $X^h Y$

	X^H	X^h
X^h	$X^H h$	$h h$
Y	$X^h Y$	$h Y$

- 1 daughter homozygous nohemophilia
- 1 daughter heterozygous nohemophilia
- 1 son nohemophilia
- 1 son with hemophilia

Pedigree

- = Female that does not display the trait ($X^H X^H$)
- = Female that does not display the trait ($X^H X^h$) but is a carrier
- = Female that displays the trait ($X^h X^h$)
- = Male that does not display the trait ($X^H Y$)
- = Male that displays the trait ($X^h Y$)

H nohemophilia
h hemophilia

	X^H	X^h
X^h	$X^H h$	$h h$
Y	$X^H Y$	$X^h Y$

girls - 50% chance hemophilia
boys - 50% chance hemophilia

	X^A	X^H
X^h	$X^A h$	$h h$
Y	$X^A Y$	$X^H Y$

girls: 100% chance nohemophilia
100% chance carrier
boys: 100% chance nohemophilia

	X^h	X^h
X^h	$X^h h$	$h h$
Y	$X^h Y$	$X^h Y$

girls 100% chance hemophilia
boys 100% chance hemophilia

Protein Synthesis

mRNA - messenger RNA

tRNA - transfer RNA

RNA - Ribonucleic Acid

transcription - transcribing - coding of DNA to make mRNA

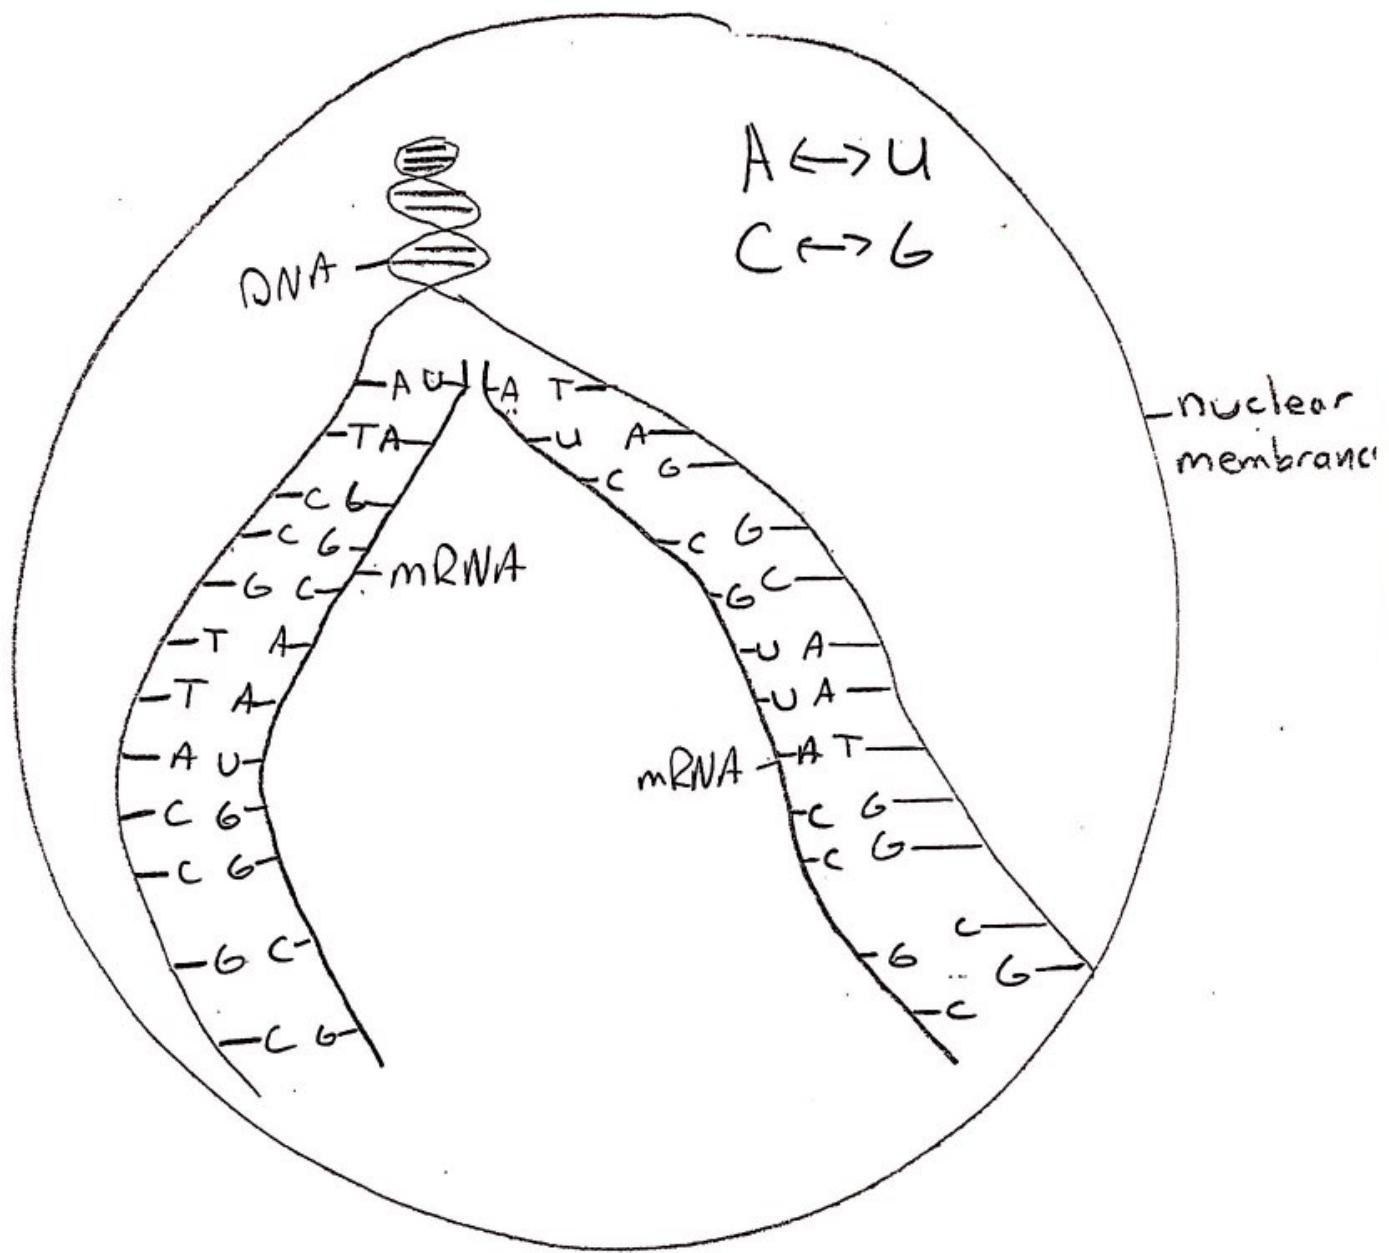

- no Thymine - replaced by Uracil
- "Unicorns eat apples"
- $A \leftrightarrow U$ $C \leftrightarrow G$

translation - tRNA reading the mRNA and "translating" that into the correct chain of amino acids

codon - set of 3 nucleic bases on the mRNA that code for a particular amino acid

anticodon - set of 3 nucleic bases on the tRNA that carry or transfer the amino acids.

Inside Nucleus

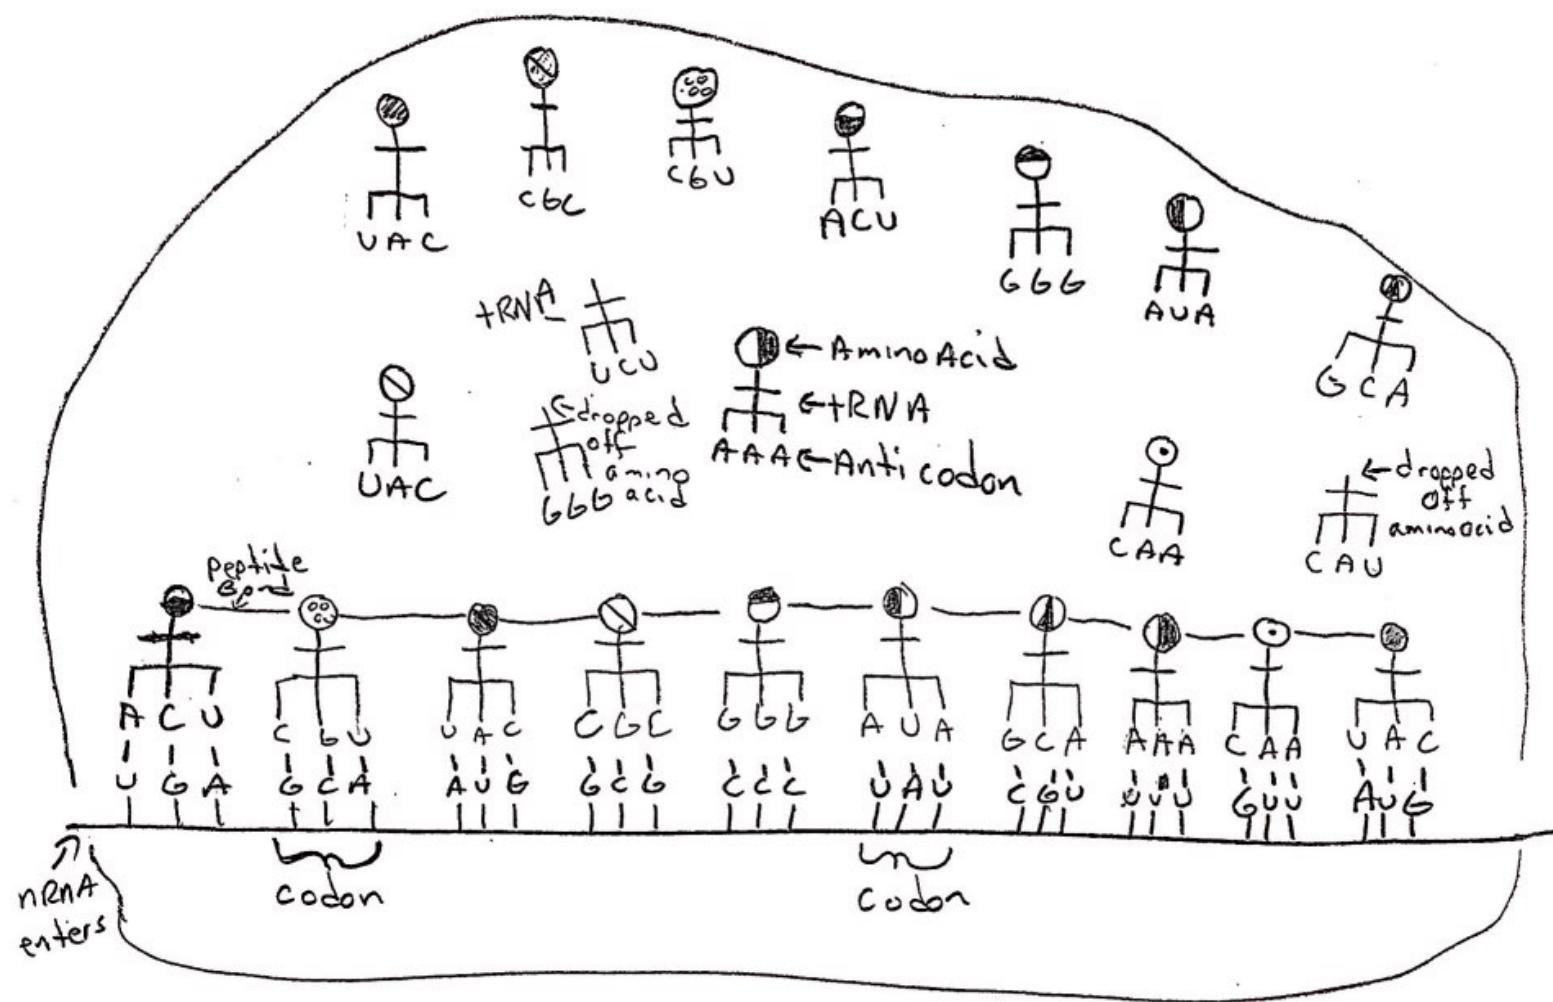

mRNA - leaves the nucleus and goes to ribosomes.
- enters ribosome to be coded

Adenine < Uracil

Cytosine > Guanine

Inside Ribosome

tRNA - transfer RNA "t"

- - amino acid
- - anticodon

mRNA - messenger RNA

CGC UAU - codon

- chain of amino acids protein
peptide bonds

mRNA Codon/Amino Acid Chart

First Base	Second Base				Third Base
U	U UUU UUC UUA UUG	C UCU UCC UCA UCG	A UAU UAC UAA UAG	G UGU UGC UGA - Stop UGG - Tryptophan (Trp)	U C A G
